Modernize your legacy TMS

with the easiest, most affordable **renovation strategy.**
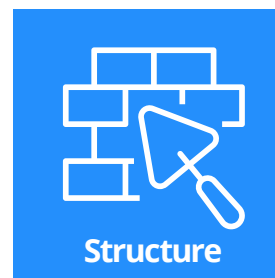

Is your TMS getting old and outdated?

Replacing a "legacy" system is expensive and disruptive. Fortunately, there is a better option.

When renovating, homeowners' best assets are a solid foundation and framing. Motor carriers and logistics service providers can use the same blueprint to modernize their TMS without a demolition.

A cloud-based integration platform can provide you with immediate access to third-party applications to expand the connectivity and performance of your TMS. More importantly, you can gain control of your technology strategy rather than wait on a TMS vendor with limited options.

Structure

Best-in-class integration platforms come with four components to modernize your TMS:

Pre-built integrations	**New features and data**	**Better data delivery**	**Faster connections**
to expand connectivity, improve workflow automation and freight visibility.	through connecting with third-party applications that would otherwise get delayed by TMS vendors.	to ensure more reliable performance and easy access to analytics.	with trading partners for end-to-end visibility and automation using EDI and real-time API communications.

Connectivity

A cloud-based integration platform can get the right information to the right places to improve:

Mobility: Connect with driver apps that deliver a comprehensive workflow with instant communications and visibility.	**Flexibility:** Create custom workflows that meet your unique needs.	**Visibility:** Generate instant driver and load status updates and automatically share them with customers.	**Compatibility:** Connect with new shipper and carrier trading partners quickly. Avoid delays and lost revenue from missed opportunities.

Visibility

A modernized TMS will also have end-to-end visibility of the load lifecycle – from order entry to dispatch.

A cloud-based integration platform lets you build your dream TMS for a small fraction of what a new system costs.

Integration solutions save time and money by quickly connecting your TMS with current and future applications to run at peak efficiency now and years to come.

About Tranztec

Tranztec offers a cloud-based platform that connects TMS, telematics and transportation services with a comprehensive set of prebuilt integrations, as well as a robust set of load dispatch functionality that extends legacy TMS applications and can provide a single view of the enterprise.

The Tranztec platform is a technological foundation for hundreds of motor carrier and logistics operations. Our open connector technology and business process automation capabilities provide a foundational hub for integration and automated workflows. The flexible and extensible platform can easily change over time to meet your evolving business needs.
